Abstract

Every new academic year brings in fresh students who are often overwhelmed, not just by classes but by the hunt for reliable study materials. Previous year question papers, useful notes and professor-recommended resources usually exist, but are scattered across WhatsApp groups, shared drives or seniors' laptops. This project proposes *SAUrte*d**, a responsive front-end website that centralises academic resources in a clean and student-friendly format. The website will be built using fundamental web technologies such as HTML5, JavaScript and CSS; and will be hosted on GitHub. By providing a single organised interface, *SAUrte*d** aims to simplify resource discovery and support more efficient exam preparation.

Introduction

For most students, academic survival often begins with one important question: "Does anyone have last year's paper?" Despite the availability of helpful resources, there is no centralised platform where students can easily find and access them. This project focuses on designing a website that organises academic content in a clear and accessible manner using front-end web technologies.

- **Problem Statement**

Students lack a centralised platform for PYQs and study resources. Current sharing methods are messy and hard to navigate. A structured, student-friendly platform can save time and reduce last-minute scrambling.

- **Target Audience**

- First-year and second-year B.Tech students preparing for examinations using past papers.
- Newly admitted SAU students seeking academic guidance.

- **Technology Stack**

The project uses HTML5 for structure, CSS for design and JavaScript for interactivity with deployment handled through GitHub Pages.

Proposed Solution

*SAUrte*d** will be a front-end website designed to make academic resources easy to find and use. It will feature clear navigation, searchable content and organised access to PYQs, books and notes, along with options for students to contribute resources.

Related Works

Several platforms already help students access academic materials. Websites like DotNotes and Fresources provide notes and previous year papers, while portals such as VTOP offer academic resources. These examples highlight the value of centralised academic support and inspired the idea behind *SAUrte*d**.

Expected Outcome

As the student community at South Asian University continues to grow, there is an increasing need for shared academic support, especially for newly admitted students. *SAUrte*d** is designed to assist students by providing organised access to previous year question papers and study materials through a clean and user-friendly interface. The initial scope of the project focuses on supporting B.Tech students.
